For the interface, I think it would also be important to allow users to request based off of key words in addition to categories, helping refine to topics within categories. A cool idea, though I'm not sure how feasible it would be, would be to monitor click-through rates of articles for a user and use that with the model as well, as often times people simply read through a page and then close it, rather than providing how they felt as this can feel like an extra step. The architecture and evaluation look great and straightforward and it seems like a cool project!
